AURORA VII

BATTLEFIELD CONDITIONS & TABLE CONSTRUCTION

Territory Guidelines with 24 Location References

Concept-art alignment revision | 21 October 2026

THE MAPS ARE GUIDELINES - NOT MANDATORY TERRAIN PLACEMENTS

Build a balanced 48" x 48" Infinity N5 table first. Use each territory and its two locations to guide terrain type, density, route character, elevation and visual identity. Layouts may differ substantially while preserving that character.

Shared Table-Building Principles

- Provide substantial total-cover positions throughout each deployment zone, including its central third; check complete armies and occupied exits.
- Create multiple protected exits and interconnected approaches. Keep important routes broad enough for TAGs and other large Silhouettes.
- Use substantial terrain to control major Line of Fire. Scatter, vehicles, barriers and foliage support the main blockers.
- Mix short, medium and controlled long sightlines; avoid clean deployment-to-deployment corridors and one dominant sniper perch.
- In mountain territories, shape the ground itself into connected slopes, valleys and terraces. Rock pillars on a flat mat do not establish a mountain landscape.
- Keep objective locations usable at the required horizontal positions. Consoles may stand inside buildings or on supported, accessible roofs.
- Preserve each territory's intended density and openness. Vary building footprints and placement rather than repeating corner buildings and perimeter shelters.
- Aim for photographic material scale, coherent ground surfaces and restrained wear; use actual relief for changes in elevation.

Reference refresh: all 12 territories now use current concept art across the 24 location references, including new Ember Highlands and Frostreach Wastes artwork. Waterfront and winter scatter sheets remain in the appendix. Territory values, location descriptions and campaign rules are unchanged.

1. NOVA PROSPECT | Pioneer's Landing | 3 VP

Aurora VII's colonial capital: permanent urban development, administration, communications and orbital supply operations.

1A - Administrative District

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

Dense civic blocks, administrative buildings and communications infrastructure. Use the map to capture a developed city with broken streets and strong building-to-building movement, not exact building locations.

- Favor substantial civic buildings and broad but interrupted streets.
- Keep the center developed without creating one dominant tower or fortress.
- Use buildings as primary LoF blockers; vehicles and street furniture are secondary.

1B - Orbital Logistics District

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

A more open logistics campus with landing operations, warehouses, cargo handling and support infrastructure. The map demonstrates how open operational space can remain tactically protected.

- Include a landing or transfer area surrounded by substantial cover rather than a large open pad.
- Use warehouses, cargo-transfer facilities and support buildings without creating a container maze.
- Keep several broad routes for TAGs and freight movement.

2. KORIN RANGE | Dragon Gate Enclave | 3 VP

An alpine mountain territory of pale fractured rock, sparse conifers, snow pockets and scientific infrastructure fitted to steep, connected ground.

2A - Research Valley

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

A research campus distributed across a sculpted valley: laboratories occupy different rock terraces, with a lower basin, rising tracks and bridges between natural spines.

- Build connected valley floors, slopes and usable terraces; place research buildings at genuinely different ground elevations.
- Fit laboratories to cliff edges and ledges. Link levels with broad ramps, switchbacks, stairs and supported crossings.
- Retain several protected routes around the rock spines and between levels; elevated sites need more than one practical approach.

2B - High Pass

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

A high mountain crossing of serrated ridges, cut roads and viaducts above a lower pass. Small service and observation sites sit on separate ledges.

- Make ridges and stepped ground define the pass. Bridges must span real cuts or lower terrain, with believable supports and level landings.
- Provide a connected lower route and broad climbing alternatives; no bridge, summit or switchback should be the only way through.
- Interrupt elevated fire lanes with rock shoulders. Keep TAG-capable turns, resting areas and protected exits on both sides.

Elevation is structural: review the ground profile from miniature height. Provide stable standing areas and traversable connections; preserve photographic slate, gravel and rock scale across every level.

3. CRYSTAL FRONTIER | Crystal Reach | 3 VP

Aurora VII's mineral frontier: fractured quarry terraces, blue-grey crystal ravines, extraction works and scattered research facilities.

3A - Faultline Works

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

An active quarry and processing site where stratified rock benches, cut faces and mineral pockets connect workshops, crushers, conveyors and loading areas.

- Use substantial quarry faces and workshops as the main LoF blockers; carry the quarry relief into the ground.
- Connect extraction equipment into a readable working site, with broad access cuts and usable loading aprons.
- Keep progressive protected approaches, several routes between terraces and usable midfield objective space.

3B - Rift Research Station

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

An irregular scientific campus around a diagonal blue-grey quartz ravine. Pale crystal clusters, broken banks and several supported bridges define the research landscape.

- End the ravine inside the board and preserve routes around both ends; it must not bisect the whole battlefield.
- Keep bridge decks and landings clear, with several practical crossing choices and connected approaches.
- Combine varied laboratories, rock masses and dense quartz pockets; retain the blue-grey mineral character.

Ground and geology: model the quarry cuts and ravine as physical relief. Match surfaces at bridges and banks, with no floating bases, overlapping decks or flickering surface layers.

4. ECHO SHORES | Freeport Echo | 2 VP

A rough, improvised coastal trade zone of docks, warehouses, cranes, markets and black-market commerce.

4A - Dockside Operations

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

A working waterfront broken into piers, dock sectors, warehouses and cargo-handling areas.

- Use water to shape the table without consuming too much playable ground.
- Provide multiple bridges, walkways or dock connections; no single crossing should be mandatory.
- Keep containers and cargo controlled enough that major buildings still define LoF geometry.

4B - Freeport Echo Market District

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

A crowded frontier market of irregular shops, workshops, awnings, stalls and improvised structures.

- Favor irregular building footprints and interconnected passages over a clean city grid.
- Use stalls and awnings for texture, not as the only cover.
- Keep primary routes usable by large Silhouettes even though the district looks crowded.

5. HARMONY PROVINCE | Harmony City | 2 VP

Aurora VII's ordered civic center: planned public spaces, government architecture and O-12 security infrastructure.

5A - Government Plaza

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

A formal civic district centered on an intentionally open public plaza.

- Preserve meaningful open civic space instead of filling the center with buildings.
- Use monuments, planters and offset government structures to create staged cover.
- Keep the table formal and monumental rather than dense and claustrophobic.

5B - O-12 Security District

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

A controlled institutional campus containing security, communications, emergency and administrative facilities.

- Use several specialized institutional buildings rather than one giant headquarters.
- Break roads and courtyards with substantial structures and landscaped security features.
- Maintain multiple lateral and diagonal routes through the campus.

6. VERDE WILDS | Greenwood Station | 2 VP

A dense equatorial wilderness where scientific outposts and expedition routes are swallowed by native vegetation and waterways.

6A - Greenwood Station Jungle Outpost

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

A scattered research outpost surrounded by dense jungle, rock masses and muddy clearings.

- Natural terrain should dominate; research buildings remain scattered.
- Use substantial jungle/rock masses as real LoF blockers rather than relying only on loose foliage.
- Keep broad, readable paths through the vegetation for large models.

6B - Greenwood River Crossing

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

A river-dominated jungle battlefield of islands, bridges and isolated scientific positions.

- Use several crossings at different depths so the river creates choices rather than a single choke point.
- Treat jungle-covered islands and rock masses as major terrain anchors.
- Preserve the unusual water-network identity instead of converting it into a conventional land table.

7. AZURE COAST | Port Meridian | 2 VP

Aurora VII's modern maritime logistics region: clean port infrastructure, customs facilities, maintenance and intermodal transport.

7A - Port Meridian Harbor Approach

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

A clean harbor approach with waterfront structures, customs, maintenance and cargo handling.

- Keep a recognizable coastline or harbor edge while retaining ample playable land.
- Use substantial port buildings and cargo compounds to interrupt broad harbor roads.
- Make the table cleaner and more organized than Echo Shores.

7B - Port Meridian Intermodal Terminal

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

An inland road/logistics terminal built around customs, inspection, transfer and dispatch facilities.

- Favor distinct functional buildings around an irregular road network.
- Break long road corridors with inspection structures, cargo masses and service facilities.
- Keep the emphasis on road freight and logistics rather than rail or maritime infrastructure.

8. EMBER HIGHLANDS | Red Mesa | 1 VP

A harsh volcanic highland frontier of dark red rock, monumental mesas, isolated settlement and geothermal activity.

8A - Red Mesa Settlement

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

A small frontier settlement threaded through enormous mesas and canyon-like routes.

- Natural geology should visually dominate the settlement.
- Use massive mesa formations as primary LoF blockers while preserving branching routes around them.
- Keep habitation and utility buildings small relative to the landscape.

8B - Geothermal Badlands

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

A lower, more fractured volcanic field with geothermal machinery, vents and localized pipe networks.

- Favor irregular ridges and broken volcanic formations rather than giant flat mesas.
- Use geothermal machinery as secondary terrain embedded in the geology.
- Keep pipes broken and crossable; do not create industrial walls.

9. SULFUR BASIN | Helios Extraction Complex | 1 VP

A chemically scarred industrial territory ranging from dense refining infrastructure to exposed sulfur-mining fields.

9A - Helios Refinery

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

A dense processing complex of refinery structures, tanks, machinery and broken pipe systems.

- Use several distributed industrial masses rather than one giant central refinery.
- Keep pipeline networks crossable and avoid long continuous pipe walls.
- Create an industrial labyrinth with multiple TAG-capable routes and controlled service corridors.

9B - Helios Extraction Fields

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

An open sulfur-mining frontier of natural formations, drilling sites, pumping equipment and short pipeline networks.

- Natural terrain should provide most major LoF blocking; extraction machinery is distributed and secondary.
- Keep the table visually open while providing progressive substantial cover across exposed ground.
- Use fewer, larger natural formations rather than filling the table with small rocks.

10. FROSTREACH WASTES | Frosthold | 1 VP

Aurora VII's polar frontier: ice masses, snow fields, survival infrastructure and isolated expedition sites.

10A - Frosthold Wastes

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

A compact polar settlement or survival installation protected by large ice formations.

- Use substantial glaciers and ice/rock masses as primary LoF blockers.
- Keep the settlement compact and subordinate to the frozen landscape.
- Preserve several broad routes around and between the ice formations.

10B - Polar Expedition Zone

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

A much more open polar wilderness containing only sparse expedition equipment.

- Natural ice terrain should overwhelmingly dominate the table.
- Use large distributed formations to make apparent open ground tactically crossable.
- Human infrastructure should look temporary, isolated and minimal.

11. NORTHWARD EXPANSE | New Al-Medina | 1 VP

A remote dry scientific frontier, from established research stations to the edge of the mapped world.

11A - New Al-Medina Research Network

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

A distributed network of permanent scientific sites across broad wind-eroded terrain.

- Natural ridges and outcrops remain the primary battlefield terrain.
- Use several distinct research functions and footprints rather than repeating one prefab building.
- Preserve the broad open-frontier appearance while maintaining protected movement between stations.

11B - Northern Survey Frontier

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

The edge of mapped territory: overwhelmingly natural terrain with tiny temporary survey camps.

- Keep permanent human infrastructure extremely limited.
- Use substantial eroded ridges and outcrops to create a hidden network of safe approaches.
- The table should look significantly more isolated and less developed than the Research Network.

12. IRON CORRIDOR | Iron Junction | 1 VP

Aurora VII's 23rd-century rail region: interstellar freight, advanced transit, robotic maintenance and inspection infrastructure, set within worked industrial ground.

12A - Iron Junction Freight Yard

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

A futuristic freight-transfer district with branching guideways, angular ceramic-and-metal halls, modular cargo trains, service equipment and sheltered working yards.

- Use substantial freight trains and transfer buildings as real cover. Break parked sections with broad crossings and useful work areas.
- Vary hall shapes and placement; extend activity into the table rather than repeating large buildings in four corners.
- Keep guideways integrated into warm concrete aprons, with protected lateral routes and recognizable loading and logistics functions.

12B - Transit & Maintenance Hub

CURRENT CONCEPT ART | TERRAIN CHARACTER & CONSTRUCTION GUIDE

A specialist service campus of open repair bays, diagnostics, control offices, passenger or maintenance trains, robotic equipment and blue-grey industrial aprons.

- Give each facility a clear function, with furnished work areas, physical repair equipment and selected accessible train interiors.
- Distribute repair halls and medium-height equipment through the campus; avoid one giant terminal or a repeated corner layout.
- Keep local service tracks, broad crossings and interconnected approaches. Trains should add usable terrain without forming a continuous wall.

Visual distinction: Freight Yard emphasizes cargo and transfer operations; the Hub emphasizes inspection and repair. Preserve photographic surfaces, readable work zones and sufficient terrain in both deployment areas.

Using the Location References Correctly

The 24 references define Aurora VII's battlefield language. A GM may rotate, mirror, substitute or redesign terrain while retaining a balanced Infinity battlefield and the selected territory's identity.

Preserve the character and the A/B distinction

Follow the reference's terrain language and route logic. Retain deliberate differences in density, water coverage, development and isolation. Add further layouts that belong to the same territory.

Translate the concept art into playable ground

For Korin Range, create real valley floors, terraces, cut roads and ridges. Elevate buildings with the land beneath them. Bridges should connect distinct ledges over genuine lower ground, with alternate routes below or around them. Give models stable standing areas and large bases room to turn.

Check orientation and objectives together

For the current Aurora VII TTS exports, player edges are world X=-24 and X=+24. Supremacy console base centres are X=+/-6, Z=+/-12. Keep grid projection enabled. Identify the selected mission and player edges before measuring objectives, and rotate the mission measurements with any table rotation.

Allow consoles inside buildings and on roofs

Keep the mission's prescribed horizontal positions, then choose a supported interior, roof or ground surface. Check contact space, access between levels and visibility when roofs are removed. Do not move a building merely to force its console onto open ground.

Review the exported table

Check overhead and miniature-height views, complete-army deployment, occupied exits, large-base routes and objective access. Review collision, roof-off states, bridge landings, seams, texture scale and surface flicker. Concept art is a visual target; it does not by itself demonstrate playability.

Scatter Terrain Concept References

Use these new prop families to reinforce each location's identity. Scatter supplements substantial Line of Fire blockers; it does not replace them or prescribe an exact layout.

Azure Coast | Port Meridian

Modern waterfront service equipment: bollards, pump skids, inspection carts, cable reels, maintenance shelters, utility cabinets, lockers and filtration equipment. Keep the coast and water visible.

Frostreach Wastes | Frosthold

Frosthold Wastes: settlement utilities and survival supplies. Polar Expedition Zone: isolated expedition instruments and temporary equipment. Keep the polar wilderness dominant and avoid repeated identical clusters.
